(54) Title: SYNTHESIS OF CYCLOPENTENE DERIVATIVES

(II)

(57) Abstract

A process is described for the preparation of the 1R-cis isomer of carbovir, [1'R,4'S]-2-amino-9-[4-(hydroxymethyl)-2-cyclopenten-1-yl]-1,9-dihydro-6H-purin-one and its physiologically acceptable salts from a compound of formula (II) (where L represents a leaving group, R1 represents a hydrogen atom or a hydroxyl protecting group and R2 represents OH, NH2 or a protected hydroxyl group). The 1R-cis isomer of carbovir is an antiviral agent with potent activity against human immunodeliciency virus (HIV).

DESIGNATIONS OF "DE"

Until further notice, any designation of "DE" in any international application whose international filing date is prior to October 3, 1990, shall have effect in the territory of the Federal Republic of Germany with the exception of the territory of the former German Democratic Republic.

SYNTHESIS OF CYCLOPENTENE DERIVATIVES

This invention relates to a new process for the preparation of certain optically active purine substituted cyclopentene derivatives and novel intermediates used in this process. In particular, the invention describes the synthesis of the IR-cis isomer of carbovir, [1'R,4'S]-2-amino-9-[4-(hydroxymethyl)-2-cyclopenten-l-yl]-1,9-dihydro-6H-purin-6-one, an antiviral agent.

GB-A-2217320 discloses a group of antiviral purine substituted cyclopentene derivatives including the lR-cis isomer of carbovir, [1'R,4'S]-2-amino-9-[4-(hydroxymethyl)-2-cyclopenten-l-yl]-1,9-dihydro-6H-purin-6-one, a compound of the formula (I)

15

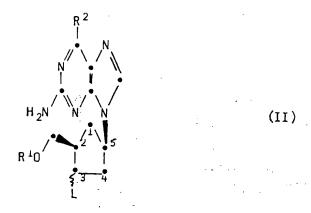

5

.10

together with processes for their preparation.

The compound of formula (I) (also referred to hereinafter as (-)-carbovir) has been found to have potent activity against human immunodeficiency virus (HIV) associated with acquired immune deficiency syndrome (AIDS) [see Vince, R., et al., Biochem. Biophys. Res. Commun., 156(2), 1046 (1988)]. There is however a need for improved synthetic routes to (-)-carbovir from relatively inexpensive starting materials.

We have now found a novel efficient process for preparing the compound of formula (I). Thus, according to one aspect of the present invention, we provide a process for the preparation of the compound of formula (I) and physiologically acceptable salts thereof, which comprises reacting a compound of formula (II)

(wherein L is a leaving group, R^{\perp} is a hydrogen atom or a hydroxyl protecting group and R^{2} is OH, NH_{2} or a protected hydroxyl group) to convert the leaving group L therein to a 3 ,4 -ene group, followed by conversion of R^{2} and/or OR^{\perp} to hydroxyl groups as appropriate, with salt formation as an optional subsequent step.

Examples of leaving group L include OH, OSO_2R^3 (where R^3 represents alkyl, for example C_{1-6} alkyl such as methyl; aryl, for example phenyl or tolyl; or trifluoromethyl), SeR^4 (where R^4 represents aryl, for example phenyl) or halogen (e.g. bromine or iodine).

The elimination of HL provides a compound of formula (III)

wherein R^{\perp} and R^{2} are as defined above.

Suitable conditions for the conversion of compounds of formula (II) to compounds of formula (III) will of course depend upon the nature of the leaving group L. Thus, for example, when L represents OH the elimination reaction may be effected by methods such as those referred to in "Compendium of Organic Synthetic Methods", Eds. I. T. Harrison and S. Harrison, Wiley-Interscience, 1971, pp. 484-488. When

L represents a halogen atom the elimination reaction may be effected by methods such as those referred to in "Compendium of Organic Synthetic Methods", Eds. I. T. Harrison and S. Harrison, Wiley-Interscience, 1971, pp. 507-510.

We have found that compounds of formula (II) in which Lrepresents $050_2 R^3$ or SeR^4 (where R^3 and R^4 are as defined above) are particularly convenient precursors to the compounds of formula (III). Such compounds in which L represents $050_{Z}R^{3}$ may be converted to compounds of formula (III) by treating the appropriate compound of formula (II) with a base, for example an alkali metal alkoxide (e.g. 10 sodium methoxide or $NaOCH_2CH_2OCH_3$) in a suitable solvent such as an amide (e.g. dimethylformamide), or a quaternary ammonium salt such as a tetraalkylammonium halide (for example a tetrabutylammonium halide such as tetrabutylammonium fluoride) in a solvent such as an ether (e.g. tetrahydrofuran). The elimination reaction involving a compound of formula (II) in which L represents $050\,\mathrm{pR}^3$ may be carried out at any suitable temperature and conveniently at $0\,{}^{
m UC}$ to ambient temperature.

Compounds of formula (II) in which L represents SeR⁸ may be converted to compounds of formula (III) by treating the compound of formula (II) with a peroxide oxidising agent such as hydrogen peroxide in a solvent such as an ether (e.g. tetrahydrofuran) conveniently at a temperature between $0\,{}^{0}\text{C}$ and ambient temperature.

Compounds of formula (III) in which OR^{\perp} and/or R^{2} represent protected hydroxyl groups may conveniently be converted to (-) carbovir by deprotection means. When two protecting groups are present deprotection at the purine ring 6-position is conveniently effected prior to removal of the other protecting group.

Compounds of formula (III) in which R^2 represents NH $_2$ or OH may conveniently be converted to (–) carbovir by removal of the R $^{ extsf{L}}$ protecting group, followed when ${\sf R}^2$ represents ${\sf NH}_2$ by conversion of the NH, group to OH.

Removal of the hydroxyl protecting groups may be effected by conventional means. Thus, for example, alkyl, silyl, acyl, alkoxyalkyl and heterocyclic groups may be removed by solvolysis, e.g. by hydrolysis under acidic or basic conditions. Aralkyl groups such as

triphenylmethyl may similarly be removed by solvolysis, e.g. by hydrolysis under acidic conditions. Aralkyl groups such as benzyl may be replaced by acyl (e.g. acetyl) groups using a carboxylic acid anydride such as acetic anhydride which, in turn, may be removed by solvolysis. Conveniently, acyl groups such as acetyl may be removed by hydrolysis under basic conditions, for example using an alkali metal alkoxide (e.g. sodium ethoxide) or using an ammonia/methanol mixture. Conveniently, alkoxyalkyl groups such as methoxyethyl may be removed under mild acid conditions, for example using a Lewis acid such as aluminium triiodide in a solvent (e.g. acetonitrile) at elevated temperature (e.g. at reflux).

Conversion of (15,4R)-4-[2,6-diamino-9H-purin-9-yl]-2cyclopentenemethanol to (-) carbovir may be effected by hydrolysis,
and preferably by treating the 2,6-diamino compound with a suitable
enzymatic hydrolysing system such as adenosine deaminase adjusted to a

15 pH in the range pH 6 to 8 (e.g. at about pH 7.5) and conveniently
buffered to the desired pH using for example disodium orthophosphate.
The reaction may be carried out at any suitable temperature and
conveniently at 20° to 50°C. The reaction may also be carried out in
the presence of a suitable solvent such as water or an alcohol-water
mixture, e.g. glycerol-water.

Compounds of formula (II) in which L represents a leaving group other than OH may be prepared from compounds of formula (II) in which L represents OH. The conversion of the 3-OH group to a different leaving group may be effected by a conventional displacement reaction. Thus, for example, compounds of formula (II) in which L represents a group OSO₂R³ (where R³ is as previously defined) may be prepared from compounds of formula (II) in which L represents OH by reaction with a sulphonyl halide of the formula R³SO₂Hal (where R³ is as previously defined and Hal is a halogen atom, e.g. chlorine). This particular displacement reaction may conveniently be effected in a solvent such as a halogenated hydrocarbon (e.g. dichloromethane) at a temperature in the range -10⁰ to +50⁰C (e.g. at about 0⁰C). The reaction preferably takes place in the presence of a base such as an amine

(e.g. triethylamine or 4-dimethylaminopyridine) or a mixture of amine bases.

When L represents SeR⁺ (where R⁺ is as previously defined) such compounds of formula (II) may be prepared via compounds of formula (II) in which L represents 0SO₂R³ (where R³ is as previously defined, e.g. methyl). The conversion of the group 0SO₂R³ to SeR⁴ may conveniently be effected by reaction of the compound of formula (II) in which L represents 0SO₂R³ with NaSeR⁴ (where R⁴ is as previously defined) in a suitable solvent such as an ether (e.g. tetrahydrofuran).

Compounds of formula (II) in which L represents OH may be prepared from a corresponding protected hydroxy compound by removal of the protecting group according to the general methods described above.

The protecting group referred to hereinabove may represent any

conventional hydroxyl protecting groups, for example, as described in
'Protective Groups in Organic Chemistry', Ed. J. F. W. McOmie (Plenum
Press, 1973) or 'Protective Groups in Organic Synthesis' by Theodora
W. Greene (John Wiley and Sons, 1981). Examples of suitable protecting
groups include groups selected from alkyl (e.g. methyl or t-butyl),
alkoxyalkyl (e.g. methoxymethyl or methoxyethyl), aralkyl (e.g.

benzyl, diphenylmethyl or triphenylmethyl), substituted aralkyl
wherein the aryl portion of the aralkyl group may be substituted by,
for example, one or more alkoxy groups (e.g. p-methoxybenzyl),
heterocyclic groups such as tetrahydropyranyl, acyl (e.g. acetyl or
benzoyl) and silyl groups such as trialkylsilyl (e.g.

25 t-butyldimethylsilyl or thexyldimethylsilyl).

When \mathbb{R}^1 represents a hydroxyl protecting group this is conveniently an aralkyl group such as benzyl.

When \mathbb{R}^2 represents a protected hydroxyl group the protecting group is conveniently an alkoxyalkyl group such as methoxyethyl.

When compounds of formula (II) contain a protected hydroxyl group at the 3'-position, the protecting group is conveniently a substituted aralkyl group such as an alkoxy substituted benzyl group (e.g. p-methoxybenzyl). Removal of the protecting group may conveniently be

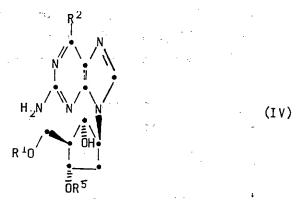

10

15

20

carried out under acidic conditions, for example using trifluoroacetic acid or by reaction with 2,3-dichloro-5,6-dicyano-1,4-benzoquinone (DDQ) followed by treatment with an acid (e.g. hydrochloric acid).

Compounds of formula (II) containing a protected hydroxyl group at the 3'-position may be prepared from a compound of formula (IV)

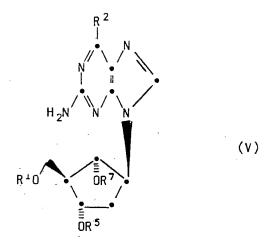

(wherein R^2 is as defined previously and R^1 and R^5 are hydroxyl protecting groups) by reacting the said compound of formula (IV) to replace the 1-OH group by a hydrogen atom.

Conveniently, this reaction is effected by (i) reacting the compound of formula (IV) to convert the 1-OH group to a leaving group removable by reduction (e.g. by homolytic reduction) and (ii) reducing said compound to replace the leaving group by a hydrogen atom.

A particularly convenient means of effecting the reaction is to react the compound of formula (IV) with a compound of formula HalC(=S)OR 6 (where Hal is a halogen atom, e.g. chlorine, and R 6 is C $_{1-6}$ alkyl, aryl such as phenyl, heteroaryl such as imidazole or C $_{1-6}$ alkylaryl such as p-tolyl) to provide a compound of formula (V)

30

5

(wherein $-0R^7$ represents a group $OC(=S)OR^6$ and R^1 , R^2 and R^5 are as defined previously), and thereafter reducing the compound of formula (V) using, for example, an alkyltin hydride (e.g. tri-n-butyltin hydride) in the presence of a radical initiator such as a peroxide, azobisisobutyronitrile or light to provide a compound of formula (II) in which the 3-position is substituted by a protected hydroxyl group.

15

The reaction of a compound (IV) to introduce the R^7 group in the compound (V) may be effected in the presence of a suitable base such as an amine (e.g. pyridine or 4-dimethylaminopyridine) and in a solvent such as a halogenated hydrocarbon (e.g. dichloromethane), conveniently at a reduced temperature (e.g. about -30 to -10° C).

20

The reduction reaction to provide the desired compound of formula (II) may conveniently be carried out in a suitable solvent, such as pyridine or toluene when an alkyltin hydride is the reducing agent, and the reaction may preferably be carried out at an elevated temperature

25

Compounds of formula (IV) may be prepared by reacting a compound of formula (VI) ${}^{\circ}$

(VI)

30

15

25

30

(wherein R^\perp and R^5 are hydroxyl protecting groups) with a purine base having the formula (VII) -

(wherein R^2 is as previously defined) in the presence of a suitable base.

Bases which may be used include alkali metal hydrides, such as sodium hydride, and the reaction may be effected in the presence of a suitable solvent, conveniently dimethylformamide when sodium hydride is the base. It may be desirable to carry the reaction out at an elevated temperature (e.g. $50^{\circ}-120^{\circ}\text{C}$) and in the presence of a crown ether (e.g. 15-crown-5).

Intermediates of formula (VII) are known compounds.

Intermediates of formula (VI) in which R⁵ represents a hydrogen atom are either known compounds described by S. M. Roberts et al., in J.

Chem. Soc. Perkin I, 1988, 549 or may be prepared by methods analogous to the methods therein for preparing the known compounds of formula (VI) in which R⁵ is a hydrogen atom. Compounds of formula (VI) in which R⁵ is a hydroxyl protecting group may be prepared from the corresponding compounds of formula (VI) in which R⁵ is a hydrogen atom by standard protection means.

Intermediates of formulae (IV) and (V) are novel compounds and form further aspects of the present invention.

Salts (e.g. physiologically acceptable salts) of the compound of formula (I) may be prepared form the corresponding free base according to the methods described in GB-A-2217320.

It is to be understood that individual steps in the process described hereinabove and sequential combinations of such steps represent further aspects of the present invention.

The following exmaples illustrate the invention but should not be construed as a limitation thereof.

- 9 -

Intermediate 1

(15,2R,3S,5R)-3-((4-Methoxyphenyl)methoxy)-2-(phenylmethoxy)methyl-6oxabicyclo[3,1,0]-hexane

A solution of $[3S-(1\alpha,2\beta,3\alpha,5\alpha)]-2-((phenylmethoxy)methyl-6-oxabicyclo[3.1.0]hexan-3-ol^1 (30.40g) in tetrahydrofuran (60ml) was added to a stirred suspension of sodium hydride (3.64g) in tetrahydrofuran (120ml) under nitrogen. The mixture was stirred at room temperature for 1 hour and 4-methoxybenzyl chloride (20.6ml) was added, followed by tetrabutylammonium iodide (510mg) and$

- dimethylformamide (30ml). The mixture was heated under reflux for 1½ hours and allowed to cool. After evaporation of most of the solvent, the remainder was diluted with diethyl ether, washed with water and brine, and dried over anhydrous magnesium sulphate. After filtration and evaporation, the residue was purified by column chromatography (Merck 7734 silica gel, eluant diethyl ether-petrol 2:1) to give the
- title compound as a yellow oil (42.4g). 'H NMR (CDCl₃) δ 7.40-7.15,

(b) (15,2R,35,55)-5-[2,6-Diamino-9H-purin-9-y1]-3-((4-methoxypheny1)-methoxy)-2-(phenylmethoxy)methyl-l-cyclopentanol,

10 phenoxythiocarboxylate

To a stirred solution of the product of part (a) above (10.00g) in dichloromethane (150ml) was added 4-dimethylaminopyridine (4.98g) and the solution was chilled to -45°C. Phenyl chlorothionoformate (3.40ml) was then added dropwise and the mixture was then stirred at -30°C for 2 hours, and then kept for 64 hours at -22°C. The solution was diluted with dichloromethane, washed with water, saturated aqueous sodium bicarbonate solution and brine, and then dried over anhydrous magnesium sulphate. After filtration and evaporation, the residue was purified by column chromatography (Merck 7734 silica gel, eluant chloroform-methanol 20:1) to give the title compound as a light yellow g u m (10.07g). 'H NMR (CDCl₃) δ 7.58, 1H, s; 7.20-7.40, 10H, m; 6.85-7.00, 4H, m; 6.15, 1H, m; 5.40, 2H, bs; 5.19, 1H, m; 4.65, 2H, bs; 4.59, 2H,s; 4.50, 2H,s; 4.16, 1H, m; 3.82, 5H, m; 2.70, 2H, m; 2.40, 1H, m.

25 (c) (1'R,3'5,4'R)-9-[3-((4-Methoxyphenyl)methoxy)-4-(phenylmethoxy) methyl-cyclopentan-1-yl]-9H-2,6-purinediamine

To a stirred solution of the product of part (b) above (11.83g) in toluene (180ml) under nitrogen, was added 2,2'-azobis (2-methylpropionitrile) (600mg) followed by tributyltin hydride 30 (8.12ml) and the solution was degassed by bubbling a stream of nitrogen through it for 10 minutes. The mixture was then heated at 90°C for 2 hours. Evaporation gave a residue which was purified by column chromatography (Merck 7734 silica gel, eluant chloroform-methanol 20:1) to give the title compound as a white solid 35 (7.50g). Crystallisation from ethyl acetate gave a pure sample of the

10

20

- 11 -

title compound, ,m.p. $132-4^{\circ}\text{C}$; $\left[\alpha\right]_{D}^{-} + 22.1^{\circ}$ (c = 0.98, CHCl₃); 'H NMR (CDCl₃) δ 7.75, 1H, s; 7.20-7.40, 7H, m; 6.86, 2H, d; 5.31, 2H, bs; 4.92, 1H, m; 4.64, 2H, bs; 4.53, 2H, s; 4.44, 2H, d; 4.04, 1H, m; 3.80, 3H, s; 3.55, 2H, d; 2.49, 2H, m; 2.30, 2H, m; 1.90, 1H, m.

(d) (15,2R,4R)-4-[2,6-Diamino-9H-purin-9-y1]-2-(phenylmethoxy)methyll-cyclopentanol

Trifluoroacetic acid (70ml) was added to the product of part (c) above (7.20q) and the resulting red solution was stirred at ambient temperature for 75 minutes. The solution was slowly added to saturated aqueous sodium bicarbonate solution (1200ml) and then extracted thrice with chloroform. The combined chloroform extracts were washed with brine and dried over anhydrous magnesium sulphate. After filtration and evaporation, the residue was purified by column chromatography (Merck 7734 silica gel, eluant chloroform-methanol 9:1) to give the title compound as a light yellow solid (3.79q). Crystallisation from chloroform gave a pure sample of the title compound. 'H NMR (CDC1₃) δ 7.55, 1H, s; 7.34, 5H, m; 5.40, 2H, bs; 4.97, 1H, m; 4.69, 2H, bs; 4.56, 2H, s; 4.44, 1H, m; 3.68, 1H, dd; 3.56, lH, t; 2.34, 4H, m; 1.80, lH, m; MS (+ve CI, CH,) m/e 355 (MH+).

(e) (1S,2R,4R)-4-[2,6-Diamino-9H-purin-9-y1]-2-(phenylmethoxy)methyll-cyclopentanol, methanesulphonyl ester

above (3.58g) in dichloromethane (340ml) under nitrogen, was added 4-dimethylaminopyridine (2.48g). Methanesulphonyl chloride (1.01ml) was added, dropwise, and the solution was stirred for 60 minutes at 0°C. The mixture was diluted with chloroform and washed with water, saturated aqueous sodium bicarbonate solution and brine, and then dried over anhydrous magnesium sulphate. After filtration and evaporation, the residue was purified by column chromatography (Merck 7734 silica gel, eluted with chloroform-methanol 12:1) to give the title compound (4.64g) as a colourless foam. Preparative thin layer chromatography gave a pure sample of the title compound. 'H NMR

(CDCl $_3$) δ 7.55, 1H, s; 7.37, 5H, m; 5.33, 2H, bs; 5.25, 1H, m; 4.92, 1H, m; 4.62, 2H, bs; 4.57, 2H, m; 3.63, 2H, m; 3.00, 3H, s; 2.58, 4H, m; 2.02, 1H, m.

(f) (1'R,4'S)-9-[4-(Phenylmethoxy)methyl-2-cyclopenten-1-yl]-9H-2,6-purinediamine

To a stirred suspension of sodium hydride (1.11g) in dimethylformamide (90ml) under nitrogen, was added 2-methoxyethanol (3.74ml), and stirring was continued for 2 hours. The resulting suspension was cooled to 00 and a solution of the product of part (e) above (4.44g) in dimethylformamide (50ml) was added with stirring. After 1 hour, the ice-bath was removed and stirring continued for 45 minutes. The mixture was then partitioned between chloroform and water, and the organic layer was subsequently washed with water and brine, dried over anhydrous magnesium sulphate, filtered and evaporated. The residue was purified by column chromatography (Merck 7734 silica gel, eluted with chloroform-methanol 20:1) to give the title compound as a gum (1.80g). H NMR (CDCl₃) δ 7.60, 1H, s; 7.30, 5H, m; 6.15, 1H, m; 5.85, 1H, m; 5.60, 2H, bs; 5.55, 1H, m; 4.84, 2H, bs; 4.52, 2H, s; 3.48, 2H, 20 m; 3.10, 1H, m; 2.80, 1H, dt; 1.68, 1H, dt.

(g) (1"R,4"S)-N-[6-Amino-9-(4-acetoxy)methyl-2-cyclopenter-l-yl)-9H-purin-2-yl]-acetamide

To a stirred ice-chilled suspension of the product of part (f) above (1.79g) in acetic anhydride (60ml) under nitrogen, was added dropwise boron trifluoride etherate (2.01ml). After 10 minutes, the ice bath was removed and stirring was continued for 1 hour, whereupon more boron trifluoride etherate (0.67ml) was added. After a further 1 hour, the reaction mixture was slowly poured into saturated aqueous sodium bicarbonate solution (360ml), which was then extracted with ethyl acetate. The combined organic extracts were washed with brine, dried over anhydrous magnesium sulphate, filtered and evaporated. The residue was purified by column chromatography (Merck 7734 silica gel, eluant chloroform-methanol 20:1) to give the title-compound as a yellow solid (1.29g). Crystallisation foam ethanol gave a pure sample

- 13 -

of the <u>title compound</u>, m.p. $225-6^{\circ}$; $[\alpha]_{D}^{22}-154.0^{\circ}$ (c = 1.00, CHCl₃) 'H NMR (CDCl₃) δ 9.51, 1H, bs; 7.73, 1H, s; 6.15, 1H, m; 5.97, 1H, m; 5.60, 1H, m; 4.14, 2H, m; 3.18, 1H, m; 2.85, 1H, dt; 2.61, 3H, s; 2.06, 3H, s; 1.70, 1H, dt.

5

(h) (15,4R)-4-[2,6-Diamino-9H-purin-9-y1]-2-cyclopentenemethanol

The product of part (g) above (1.14g) was suspended in ethanol (120ml) and 2M aqueous sodium hydroxide solution (5.1ml) was added. The mixture was then heated at 40° C for 3 hours, cooled and evaporated. The white residue was purified by column chromatography (Merck 7734 silica gel, eluted with chloroform-methanol 5:1) to give the title compound as a white solid (750mg). Crystallisation from isopropanol gave a pure sample of the title compound. 'H NMR (d° DMSO) δ 7.63, 1H, s; 6.75, 2H, bs; 6.10, 1H, m; 5.84, 3H, m; 5.36, 1H, m; 3.43, 2H, m; 2.85, 1H, m; 2.60, 1H, dt; 1.58, 1H, dt.

15

(i) (1'R,4'S)-2-Amino-9-(4-(hydroxymethyl)-2-cyclopenten-l-yl)-1,9-dihydro-6H-purin-6-one

To a solution of the product of part (h) above (112mg) in pH7.5 buffer (7.5ml) (from 0.5M disodium orthophosphate, adjusted with orthophosphoric acid) was added adenosine deaminase (28µl, 44 units) in 50% glycerol – 0.0lM potassium phosphate, pH6.0, and the solution was warmed at 37°C for 5 days. The resulting white precipitate was filtered off and recrystallised from hot water to give the title compound white crystals (26mg) m.p. 265-70°C (decomp.); $\lfloor \alpha \rfloor_D$ -43.1° (c = 0.32, DMS0); 'H NMR (d⁶ DMS0) δ 10.55, 1H, bs; 7.58, 1H, s; 6.44, 2H, bs; 6.10, 1H, m; 5.85, 1H, m; 5.32, 1H, m; 4.74, 1H, t; 3.43, 2H, m; 2.86, 1H, m; 2.60, 1H, dt; 1.58, 1H, dt.

Example 2

- 30 (1'R,4'S)-2-Amino-9-(4-(hydroxymethyl)-2-cyclopenten-l-yl)-l,9-dihydro-6H-purin-6-one
 - (a) (15,2R,3S,5S)-5-[2-Amino-6-(2-methoxyethoxy)-9H-purin-9-y1]-3-((4-methoxyphenyl)methoxy)-2-(phenylmethoxy)methyl-1-cyclopentanol

10

20

To a stirred suspension of lithium hydride (195mg) in dimethylformamide (90ml) under nitrogen was added 2-amino-6-methoxyethoxy purine (7.15g) and the suspension was heated at $120\,^{\circ}\mathrm{C}$ for 1h and then cooled to ambient temperature. To this solution was added a solution of Intermediate 1 (8.06g) in dimethylformamide (60ml) and the mixture was heated at 145° C for $3\frac{1}{12}$ hours. After cooling to ambient temperature, the solvent was removed and the residue was taken up in This mixture was washed with water, and brine, dried ethyl acetate. over anhydrous magnesium sulphate, filtered and evaporated. residue was purified by column chromatography (Merck 7734 silica gel, eluted with ethyl acetate-ethanol 9:1) to give the title compound as a white solid (6.92g). Crystallisation from ethyl acetate gave a pure sample of the <u>title compound</u>, m.p. $118-20^{\circ}\text{C}$; $\left[\alpha\right]_{0}^{2}$ -5.74° (c = 1.61, CHCl₃); 1 H NMR (CDCl₃) δ 7.52, 1H, s; 7.40-7.20, 7H, m; 6.86, 2H, d; 4.88, 2H, bs; 4.65, 3H, m; 4.53, 2H, s; 4.46, 2H, bs; 4.25, 1H, t; 15 4.01, 1H, m; 3.80, 5H, m; 3.64, 2H, m; 3.42, 3H, s; 2.54, 1H, m; 2.43, 1H, m; 2.28, 1H, m.

(b) (15,2R,35,5S)-5-[2-Amino-6-(2-methoxyethoxy)-9H-purin-9-y1]-3-((4-methoxyphenyl)methoxy)-2-(phenylmethoxy)methyl-l-cyclopentenol, phenoxythiocarboxylate

To a magnetically stirred solution of the product of part (a) above (8.04g) and dimethylaminopyridine (2.85g) in dichloromethane (85ml) under nitrogen at $0^{\circ}\mathrm{C}$ was added phenylchlorothionoformate (1.95ml), dropwise. The mixture was stirred at $0^{\circ}\mathrm{C}$ for 15 minutes 25 then at ambient temperature for 30 minutes. A further aliquot of phenylchlorothionoformate (0.1ml) was added and stirring continued for an additional 20 minutes. The reaction mixture was diluted with dichloromethane and then washed with water, saturated aqueous sodium bicarbonate and brine. The organic solution was dried over anhydrous 30 magnesium sulphate, filtered and the solvent removed. The residue was purified by column chromatography (Merck 7734 silica gel, eluant chloroform-ethyl acetate 1:1) to give the title compound (9.01g) as a colourless foam. 1 H NMR (CDC1₃) δ 7.64, 1H, s; 7.40-7.20, 10H, m; 6.92, 4H, m; 6.17, 1H, t; 5.20, 1H, m; 4.81, 2H, bs; 4.63, 2H, t;

WO 91/01318 PCT/EP90/01199

4.57, 2H, s; 4.50, 2H, s; 4.14, 1H, m; 3.80, 7H, m; 3.42, 3H, s; 2.68, 2H, m; 2.40, 1H, m.

(c) (1'R,3'S,4'R)-6-(2-Methoxyethoxy)-9-[3-((4-methoxyphenyl) methoxy)-4-(phenylmethoxy)methyl-cyclopentan-1-yl]-9H-purin-2-amine

5

To a magnetically stirred solution of the product of part (b) above (9.01g) in toluene (140ml) under nitrogen was added 2,2'-azobis(2-methylpropionitrile) (500mg) and tributyltin hydride The mixture was degassed and then heated at 90° C for 1% A further aliquot of 2,2'-azobis(2-methylpropionitrile) 10 hours. (154mg) and tributyltin hydride (1.8ml) were added and the mixture heated at $100\,^{0}\mathrm{C}$ for 1 hour. The mixture was allowed to cool overnight and then evaporated. The residue was purified by column chromatography (Merck 7734 silica gel, eluant ethyl acetate-ethanol 9:1) to give the title compound (5.56g) as a gum. ^{1}H NMR (CDC1.) δ 15 7.64, 1H, s; 7.40-7.20, 7H, m; 6.87, 2H, d; 4.95, 1H, m; 4.80, 2H, bs; 4.63, 2H, t; 4.52, 2H, s; 4.45, 2H, s; 4.04, 1H, m; 3.69, 5H, m; 3.53, 2H, m; 3.42, 3H, s; 2.60-2.20, 4H, m; 1.85, 1H, m.

(d) (15,2R,4R)-4-[2-Amino-6-(2-methoxyethoxy)-9H-purin-9-y1]-2-(phenylmethoxy)methyl-1-cyclopentanol

To a magnetically stirred solution of the product of part (c) above (5.43g) in dichloromethane-water (200ml, 19:1) was added 2,3-dichloro-5,6-dicyano-1,4-benzoquinone (2.78g). The mixture was stirred vigorously overnight. The reaction mixture was diluted with dichloromethane and repeatedly washed with saturated aqueous sodium bicarbonate. The combined aqueous washings were back extracted with dichloromethane. The combined organic extracts were washed with brine and the solvent removed. The residue was dissolved in hydrochloric acid (2N) and washed with ethyl acetate. The organic washings were extracted with hydrochloric acid (2N). The combined aqueous extract was basified (pH 9) by addition of solid sodium carbonate and then extracted with dichloromethane. The organic solution was washed with dried over anhydrous magnesium sulphate, filtered and evaporated. The residue was purified by column chromatography (Merck 35 7734 silica gel, eluant chloroform-methanol 9:1) to afford a brown

3.48, 2H, d; 3.43, 3H, s; 3.10, 1H, m; 2.80, 1H, dt; 1.65, 1H, dt; MS (+ve CI, CH₄) m/e 396 (MH+, B+), 364, 210.

(1"R,4"S)-N-[1,9-Dihydro-9-(4-((acetoxy)methyl)-2-cyclopenten-1yl)-6-oxo-6H-purin-2-yl]-acetamide

To a magnetically stirred solution of the product of part (f)(ii) or (f)(iii) above (2.39g) in acetonitrile (40ml) under nitrogen was added a solution of aluminium triiodide (0.52M; 18.0ml) in acetonitrile. The mixture was heated at reflux for 2 hours and allowed to cool overnight. The mixture was diluted with methanol and the resultant solution evaporated. The residue was purified by column chromatography (Merck 7734 silica gel, eluant chloroform-methanol 9:1) to afford a gum. This was dissolved in acetic anhydride (25ml) and cooled to 0°C. The stirred solution was treated with boron trifluoride etherate (0.76ml), dropwise, under nitrogen. The mixture was stirred at $0^{0}\mathrm{C}$ for 10 minutes and then at ambient temperature for 1½ hours. The mixture was poured into aqueous saturated sodium bicarbonate solution and the product extracted into ethyl acetate. The organic extracts were washed with brine, dried over anhydrous magnesium sulphate, filtered and the solvent removed. The residue was purified by column chromatography (Merck 7734 silica gel, eluant chloroform-methanol 19:1) to afford the crude product. triturated with diethyl ether and dried in vacuo to give the $\underline{\text{title}}$ compound (265mg) as a fawn powder. M.p. 144-6°C; $\lfloor \alpha \rfloor_D^2 + 4.96°$ (c = 1.25, CHCl₃) 'H NMR (CDCl₃) δ 12.05, 1H, bs; 9.80, 1H, bs; 7.70, 1H, 25 s; 6.07, 1H, m; 5.83, 1H, m; 5.44, 1H, m; 4.59, 1H, dd; 4.22, 1H, dd; 3.21, 1H, m; 2.76, 1H, dt; 2.34, 3H, s; 2.11, 3H, s; 1.81, 1H, dt.

(h) (1'R,4'S)-2-Amino-9-(4-(hydroxymethyl)-2-cyclopenten-l-yl)-1,9dihydro-6H-purin-6-one

To a stirred solution of the product of part (g) above (157mg) in 30 methanol (5ml) was added a saturated solution of ammonia in methanol The mixture was stirred at ambient temperature overnight. The solution was evaporated and the residue purified by column chromatogrpahy (Merck 7734 silica gel, eluant chloroform-methanol 4:1)

- 19 -

to afford the crude product. Recrystallisation from water gave the $\frac{\text{title compound}}{\left(75\text{mg}\right)} \text{ as white crystals. M.p. } 272-4^{\text{UC}} \text{ (decomp.),} \\ \left[\alpha\right]_{D}^{23} \text{ -68}^{\text{0}} \text{ (c = 0.40, MeOH); }^{\text{1}} \text{H NMR (d}^{\text{6}} \text{ DMS0)} \text{ δ 10.58, 1H, bs; 7.59,} \\ 1\text{H, s; 6.45, 2H, bs; 6.61, 1H, m; 5.85, 1H, m; 5.33; 1H, m; 4.74, 1H,} \\ \text{t; 3.44, 2H, t; 2.87, 1H, m; 2.58, 1H, dt; 1.57, 1H, dt.}$

ANNEX TO THE INTERNATIONAL SEARCH REPORT ON INTERNATIONAL PATENT APPLICATION NO.

EP 9001199

SA 39043

This annex lists the patent family members relating to the patent documents cited in the above-mentioned international search report. The members are as contained in the European Patent Office EDP file on 23/10/90

The European Patent Office is in no way liable for these particulars which are merely given for the purpose of information.
